

Clinical Visit Note

Aevara Medical Group — Confidential Patient Record

Patient Information

Patient Name	Robert Martinez
Date of Birth	1949-05-30
Visit Date	2023-09-25
Provider	Dr. James Rodriguez, Internal Medicine

Chief Complaint

Patient presents with right knee pain and swelling that started after a fall during basketball two weeks ago.

Diagnosis

ICD-10 Code	J44.9
Description	Pain in right knee

Clinical Notes

Right knee examination reveals moderate effusion, tenderness over medial joint line, and positive McMurray's test suggesting possible meniscal involvement. Range of motion is limited to 0-110 degrees flexion due to pain. X-rays show no fractures or significant osteoarthritic changes. MRI ordered to evaluate for meniscal or ligamentous injury.

Treatment Plan

Initiate conservative management with RICE protocol (rest, ice, compression, elevation), NSAIDs (Ibuprofen 400mg three times daily), and physical therapy starting next week. Provide crutches for ambulation support and knee immobilizer for stability.

Follow-Up

Schedule MRI within one week and return for follow-up after imaging results. Begin physical therapy twice weekly. Use crutches as needed and avoid weight-bearing activities. Return immediately if experiencing increased swelling, severe pain, or signs of instability.
